

SpaceXAI Pitch and Demo Challenge

Audience: Global CTO · VP of Engineering · VP of Developer Experience

FORMAT

Mock Customer Meeting

DURATION

60 minutes

CONFIDENTIALITY

Confidential

SCENARIO

You are the Field Engineer supporting a strategic evaluation at a large global enterprise (of your choosing) with 5,000+ engineers across many business units. They currently use GitHub Copilot and are evaluating whether to expand that investment, move to Cursor, or pursue an alternative from a major AI lab such as Anthropic or OpenAI. Their broader goal is to transform their software development lifecycle across a complex engineering organization.

Assume a mix of modern microservices, large monoliths, legacy systems, internal platforms, many programming languages, and older frameworks such as VB6 and COBOL. They also use a typical enterprise stack: GitHub, Atlassian/Jira, observability platforms, and CI/CD systems.

The twist: you flew in for what was meant to be a joint meeting with your Account Executive, who normally opens with framing and runs discovery. Their inbound flight just got stranded on the tarmac and they won't make it. The room is full, the stakeholders are waiting, and the meeting is now yours to run end to end (opening, discovery, demo, objection handling, and next steps).

OBJECTIVE

Run a real enterprise customer meeting, not a product overview. Discovery comes first: confirm assumptions and priorities with CTO / VP Eng / VP DevEx before any sustained demo. Then tailor a live Cursor demo to what you heard and make a clear case for Cursor over Copilot or a lab-led approach. Cover technical and business value (ROI, cost, risk, change management). Close with owners, success criteria, and a concrete proposed next step (for example a POC or evaluation path).

SESSION FORMAT

60 minutes total: about 45 for the customer meeting, then 15 for feedback.

Required arc: open and frame, run discovery first, then a tailored live Cursor demo, handle objections, and close.

Panel plays CTO / VP Eng / VP DevEx. Expect pushback on ROI, failed POCs, security, and legacy (including COBOL/VB6). Land owners, success criteria, and a proposed next step.

WHAT TO BRING

A short framing intro

A Cursor demo environment: either expand on your SDK/API exercise, or build something new

Assumptions you made in prep

A proposed next step: owners, success criteria, and how you'd evaluate

PREPARATION & MATERIALS

Map each stakeholder's priorities, their Copilot footprint, and how you position Cursor vs Copilot or a lab-led approach.

Either path is fine: expand on what you built for the SDK/API exercise, or prep a new demo.

You may use: the Cursor product, public Cursor docs and writeups, your own notes, and the optional deck attached here. Clarifying questions to the recruiter anytime.
